

High Energy Plus Hand Feeding

DESCRIPTION

This product is intended for hand-rearing parrot species which require diets specially high in fat (like *Ara chloropterus*, *Ara ambiguus*, *Anodorhynchus hyacinthinus*, *Guaruba guaruba*, *Pionites melanocephalus*,...). It contains a mix of vegetable fat suitable for these species: palm and coconut oil. It also contains papaya, which promotes digestive transit.

It is a follow-on hand feeding formula, and should be used from the moment pin feathers begin to emerge until weaning. For example, in *Ara chloropterus* it is used from the 4th week of life.

It is formulated to constitute 100 % of the parrot's diet during this period.

FEEDING RECOMMENDATIONS

Confirm that the crop is empty in the morning.

It is advisable to use a first-age hand feeding formula for younger birds like **Psittacus Psittacine Crop Milk** or **Neonatal Hand Feeding** (depending on the age of the chick).

At weaning switch progressively to **Psittacus Omega** for a year.

Leftover formula must be discarded after each feeding bout.

Once the package is opened, store in an air-tight container in a cool, dry place.

While refrigeration is not advisable, freezing is possible if the package is hermetically sealed.

5 kg

PREPARATION

Mix with lukewarm water at a concentration of 20-25 % (similar texture of a shaken yogurt).

DAILY INTAKE

Average intake is around 7-10 ml per 100 g of body weight and feeding bout. The number of feeding bouts per day depends on the stage of development of the chick. Crop should be full but not overstuffed.
