

Parrot Hand Feeding

DESCRIPTION

It is designed for hand-rearing medium-sized parrot species (such as Sun Parakeets, *Pyrrhuras*, Kramer's Parakeets, Monk Parakeets, and caiques). It contains papaya, which favours the digestive transit.

It is a continuation hand feeding formula that should be used from the moment pin feathers emerge until weaning. It is formulated to constitute 100 % of the parrot's diet in this phase.

FEEDING RECOMMENDATIONS

It is advisable to confirm that the crop is empty in the morning.

For younger animals, use a first-age hand feeding formula such as **Psittacus Psittacine Crop Milk** or **Neonatal Hand Feeding** (depending on the age of the chick).

At weaning switch progressively to **Psittacus High Protein Breeding**, **Mini** or **Minor** depending on the species.

After each feeding bout, the leftover formula should be discarded.

Once the package is opened, it should be stored in the original package properly sealed, or in an air-tight container in a cool, dry place.

It is not recommended to keep the product in the refrigerator. However, it is possible to freeze it, as long as it is kept in a tightly closed container.

PREPARATION

It should be prepared by adding lukewarm water to the powdered formula and mixing with a whisk until it reaches a concentration of 20-25 % (texture similar to a beaten yogurt).

DAILY INTAKE

Average intake is around 7-10 ml per 100 g of body weight and feeding bout. The number of feeding bouts per day depends on the stage of development of the chick and the species. Crop should be full but not overstuffed.
