

Silex Grit Coarse

DESCRIPTION

Silex Grit Coarse is a supplementary food for medium and large birds with a marked granivorous specialization like parrots, pigeons, pheasants..

Insoluble grit is essential to guarantee an optimal function of the gizzard and the digestive system of highly granivorous birds.

Its function is purely mechanical and should not be confused with calcium grits, which have a nutritional function as a source of calcium. Contrary to calcium grits, **Silex Grit Coarse** does not dissolve in the gizzard by the action of gastric acids. The availability of **Silex Grit Coarse** will avoid the consumption in excess of other grits without a mechanical function which could lead to health problems.

This flint sand is calibrated to the optimum size to be ingested by these species (1-2 mm).

FEEDING RECOMMENDATIONS

Offer *ad libitum* in a separate feeder. If the feeder prevents the grit from getting wet or dirty, it will remain unaltered for weeks.

DAILY INTAKE

Birds can regulate the intake of silex sand according to their needs.

NUTRITIONAL INFORMATION

COMPOSITION:

Silica sand calibrated to 1-2 mm (Silicon dioxide).

ANALYTICAL CONSTITUENTS:

Moisture 5.0 %, Crude ash 95.0 %.

PACKAGING

1.5 kg jar.

1.5 Kg
